SIT-LOCK® self locking elements

Advantages of SIT-LOCK® on the shaft-hub connection compared with traditional systems

Easy assembly and disassembly
Both actions take place by locking and unlocking the clamping screws with common tools.
The use of a torque wrench is only necessary when a more precise torque is required.

Superior holding power
The action of the clamping cones creates shaft clamping torque superior to a normal keyed hub.

Overload protection
When the pre-set torque is exceeded SIT-LOCK® will slip, preventing the connected elements from being broken.
Note: SIT-LOCK® units are not friction couplings so, excessive slip will cause damage.

Easy adjustment
Combining the SIT-LOCK® design of smooth cone action with superior holding power, the hub can be clamped at any position along a shaft, eliminating the need for lock washers, spacers, stop rings, etc.

Precision location
With the SIT-LOCK® smooth cone action, the SIT-LOCK® is ideal for clamping cams, timing devices, and indexing mechanisms accurately and precisely.

Temperature
-20 °C ÷ 150 °C

Unlimited use possibilities
SIT-LOCK® units are suitable to connect any type of hub (flywheels, chainwheels, gears, levers, pulleys, eccentrics, coupling, etc).

Various solutions in stock
Available in stock in 10 different types, SIT-LOCK® units can be utilized in a varied range of industrial applications

Order form

SIT-LOCK® **CAL 1 F25 /50**

- CAL: SIT-LOCK® self locking element
- Type
- Shaft diameter
- External diameter (hub bore)

Performances

Given values of transmissible torque, axial force, and pressure between shaft and hub are valid for a lubricated installation (friction coefficient μ=0,12). Both hub and shaft, as well as locking unit's contact surfaces and screws, should be lubricated.

Locking unit and screws are supplied already oiled.

Always consider tolerances and roughness values per single locking unit.

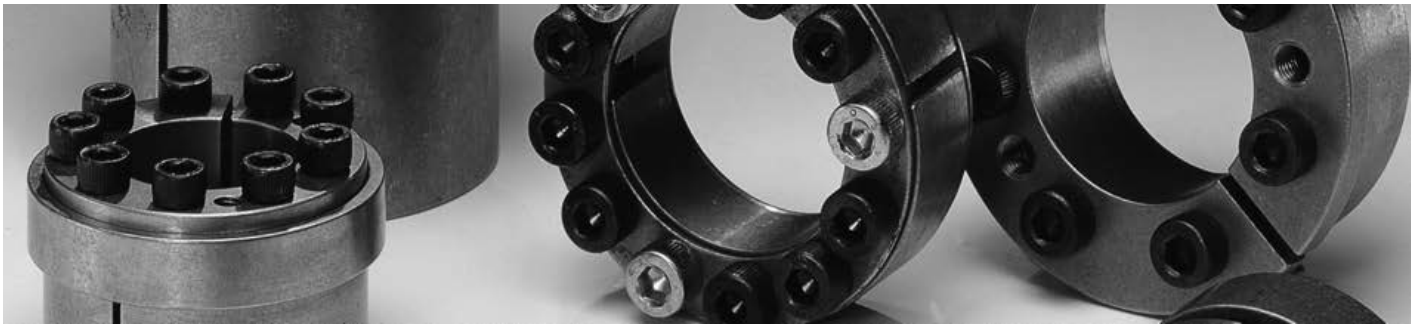
To avoid decrease of locking unit performances, do not use molybdenum disulfide lubricant or other substances that drastically reduce coefficient of friction.

Design procedure

For a correct functioning of SIT-LOCK®, the transmissible torque M_T (stated in this catalogue) must always exceed the maximum torque in operation. So, in selecting the SIT-LOCK® dimensions, you must consider the start up torque could be even 4 times larger than the nominal one.
The transmissible axial forces (F_{ax}) given in the tables are valid for cases where there is no torque. If it is necessary to transmit both a torque and an axial force (ex. helical gear), the following formula must be used:

$$M_T \geq \sqrt{M_a^2 + \left(\frac{F_{ax} \cdot d}{2000}\right)^2} \quad [Nm]$$

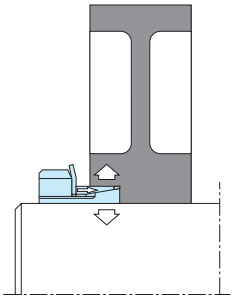
where:
M_a = maximum torque to be transmitted [Nm]
F_{ax} = axial force in operation [N]
d = shaft diameter [mm]

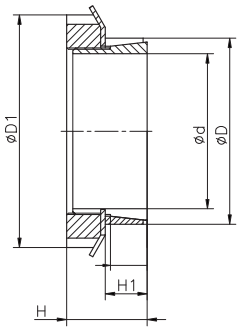


SIT-LOCK® 9 - Not Self-Centering

Consists of two tapered rings and a lock nut. In virtue of the simple design, very fast assembly/disassembly is allowed.

SIT-LOCK® 9 is suitable for applications with small-medium torques.





Installation

Carefully clean contact surfaces of shaft and hub. Then lightly oil both surfaces with standard mineral oil. Position the SIT-LOCK® in the machined bore of the hub. Insert the shaft. Gradually and uniformly tighten the locking nut to the tightening torque (Ms).

Note: once the tightening torque is reached, do no tighten the locking nut anymore.

Do not use lubricant like "Molykote" or molybdenum disulfide based oils.

Removal

Loosen the lock nut until the SIT-LOCK® is completely released.

Notes:
Dimensions representing the total length of the hub are indicative; they are calculated according to the geometric rules.

For assemblies requiring larger dimensions, contact our Technical Department.

Note:
M_T, F_{ax}, P_w and P_n stated in this catalogue are valid for application 1. For application 2, they have to be increased by 25%.

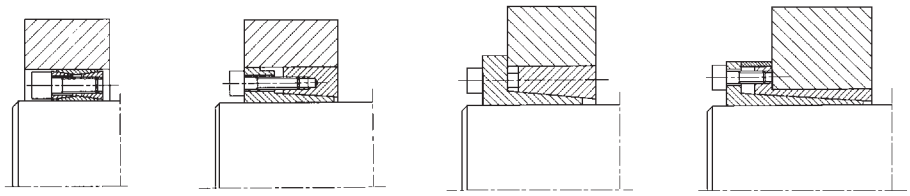
Maximum allowable roughness
Rt 16 µm
Maximum recommended tolerance
shaft h 8 - hub H 8

M_S	Screw tightening torque	Nm
M_T	Transmissible torque moment	Nm
F_{ax}	Transmissible axial load	N
p_w	Shaft pressure	N/mm^2
p_n	Hub pressure	N/mm^2

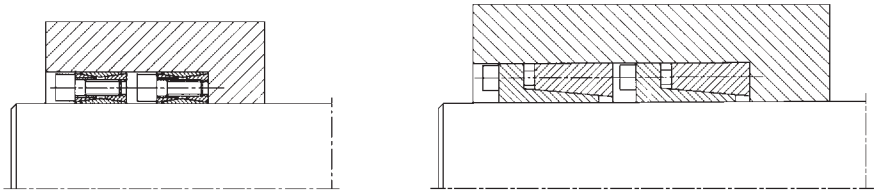
Design of hub outside minimum diameter

When using the locking units, the shaft-hub connection is characterized by a pressure on the hub surface, which is exerted by the locking unit outer ring when the clamping screws are tightened to the stated value. It is important to design correctly the hub outside diameter. The following table summarizes the procedure as a simple calculation. To determine the hub outside minimum diameter, simply multiply the factor K by the SIT-LOCK® outside diameter to obtain the hub outside minimum diameter. The factor K varies depending on the yield limit of hub material, the hub surface pressure (Pn) and the factor (x), variable according to the application type (A, B, C).

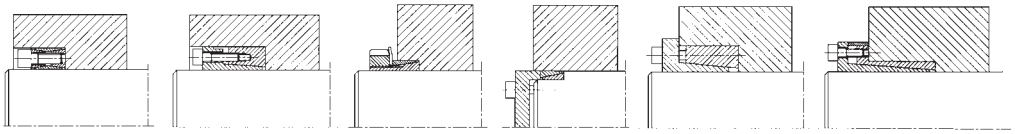
Installation type A ($L_M \cong L_C$)
X = 1



Installation type B ($L_M \cong 2\ L_C$)
X = 0,8



Installation type C ($L_M > 2\ L_C$)
X = 0,6



Hub min diameter D x K

for: K = factor stated in the table
D = SIT-LOCK® outside diameter

L_M	Hub length	mm
L_c	SIT-LOCK® length	mm

Hollow shaft

For application with locking-assemblies on hollow shaft, it is important to scale both hub minimum diameter and hollow shaft diameter. Contact our Technical Department for design.

Coefficient K

Note: p_n is stated in the dimensional table of each of the locking assemblies. Installation type (A, B, C) are stated in the previous page.

Example of calculation procedure

Design data
- Power transmission element to be connected: V-pulley
- Shaft diameter: 50 mm
- Maximum Torque in operation (Ma): 1.500 Nm
- V-pulley material: cast iron GG20
- Yield limit of V-pulley material: 150 N/mm²

Calculation
- SIT-LOCK® type: for this kind of applcation SIT-LOCK® 1 is suggested
- Size selection: 50 x 80 mm (see table SIT-LOCK® 1)
- Performance control: verify $M_T \geq Ma$

  From the table obtain M_T = 1.889 Nm, so the above condition is verified
- Tolerance: h11 for the shaft - H11 for the SIT-LOCK® bore
- Roughness: $R_t \leq 16$
- Screws tightening torque: M_S = 37 Nm (see table SIT-LOCK® 1)
- Hub surface pressure: from the table you can find the value P_n = 125 N/mm²
- Application type: in this case it is preferable to adopt the application “C” with the centering guide between shaft and hub
- Coefficient K : obtained through the table “Coefficient K” by considering the following information:
  - yield limit of hub material = 150 N/mm²
  - hub surface pressure = 125 N/mm²
  - installation C

Then, K = 1,74

- Hub outside minimum diameter:

  $Hub\ D_{min} \geq D \cdot K$

  for

  - D = SIT-LOCK® outside diameter [mm]
  - K = 1,74

Then, hub D_{min} = (80 • 1,74) = **140 [mm]**

DIN 912

Screw diameter	P_V [N]			M_S [Nm]
